

CO-DEVELOPMENT & CO-INVESTMENT PROPOSAL

ECOGRID RESORT™

The intelligent micro-grid for low-carbon holiday villages

Multi-brand SaaS platform orchestrating solar generation, storage and usage — built for open-air tourism

OUR FOCUS

What we are — and what we are not

What we ARE

- The SaaS platform that orchestrates multiple hardware brands
- The tourism vertical: guest app, occupancy, ESG, labels
- Distribution access to campsites via the COREPROMA ecosystem

What we are NOT

- A hardware manufacturer (inverters, batteries)
- A mere inverter EMS — that is a commodity
- Locked to a single brand

Our moat

- Distribution: already-existing access to the segment
- Occupancy data (bookings) → AI load forecasting
- Multi-brand orchestration + tourism / ESG layer

In plain terms

FoxESS, SolarEdge, Huawei, OCPP... = integrated hardware and data sources. ECOGRID is the software layer above: hardware-agnostic, wired into tourism and COREPROMA distribution.

Not a solar installer — an energy-services platform

ECOGRID RESORT™ runs as the “operating system” of a resort: it orchestrates physical assets and on-site usage in real time to maximise solar self-consumption, cut grid peaks and protect guest comfort.

Produce

- On-site solar PV: car-park shades, roofs, pergolas
- Turns idle surfaces into productive assets

Store & manage

- 4–8 MWh LFP batteries: resilience + arbitrage
- AI EMS forecasts and dispatches 24/7

Distribute & charge

- Smart dispatch across pools, A/C, hot water
- 30–50 EV charge points, smart charging

Engage & report

- Guest app: EcoScore, EV booking, rewards
- Carbon reporting for operator ESG

The same software core scales across campings, villages, resorts and islands — standardised kits, site-specific hardware.

Southern-Europe outdoor tourism — and why now

Target segment

- Campings, holiday villages, resorts & eco-destinations
- Priority geographies: Spain, Italy, Corsica, Sardinia — ≈ 12,000 open-air sites
- High summer energy peaks, large solar-ready surfaces

The client pain

- Volatile bills: A/C, pools, catering, hot water, lighting
- Grid limits & connection constraints in tourist zones
- Guests now expect visible, measurable low-carbon proof

Regulatory tailwind

- EU EPBD 2024/1275: solar-on-buildings roll-out
- France loi APER: solar mandatory on large car-parks
- CSRD: sustainability reporting pushes operators to act

Why now: Fragmented, energy-hungry, under-served — and increasingly obliged to decarbonise. The hard part is distribution; the COREPROMA ecosystem already reaches this exact segment.

What the operator actually gains

Business advantages

- Lower, predictable energy bills — hedge against price volatility
- Energy resilience & continuity (critical on islands)
- Premium positioning & loyalty with eco-conscious guests
- Higher asset value; ahead of regulation, not chasing it
- Access to subsidies and green financing
- Audit-ready ESG data for chains, banks and investors

Labels & certifications within reach

- Green Key / La Clef Verte — tourism eco-label
- EU Ecolabel for tourist accommodation
- Travelife · Biosphere · Green Globe certifications
- ISO 50001 (energy) & ISO 14001 (environment)
- Guarantees of Origin for renewable electricity
- Carbon footprint (Bilan Carbone / ISO 14064)

ECOGRID RESORT™ can productise label support and carbon reporting inside the SaaS — turning compliance into a recurring, high-margin service.

Marine de Caprone — Ghisonaccia, Corsica

5.7 M€

Indicative pilot CAPEX

860 k€

Target annual gains

6–8 yrs

Indicative payback

70–90%

CO₂ avoided (target)

Target sizing

- ~2 MWc solar PV — long-term productive asset
- ~6 MWh LFP storage — resilience + arbitrage
- 30–50 EV charge points — premium service + revenue
- AI EMS 24/7 — optimisation & reporting

Target energy mix (high season)

⚠ Figures are an unaudited central scenario (per the investor dossier). They must be confirmed by an energy engineering study, supplier quotes and a detailed financial model.

An asset + SaaS hybrid, not hardware sales

1 • Build & integrate

- Studies, micro-grid design, engineering
- Equipment supply, install & commissioning
- EPC margin on every new site

2 • Recurring software & O&M

- SaaS licence: EMS, dashboards, ESG reporting
- Maintenance, 24/7 supervision, optimisation
- High-margin, sticky recurring revenue

3 • Energy value

- Self-consumption savings & surplus resale
- EV charging & premium services
- Flexibility / VPP services to the grid

4 • Platform & network

- Energy-as-a-Service (shared-savings)
- Carbon & ESG advisory, marketplace commissions
- Brand franchise / licence across Europe

At maturity, enterprise value comes from the connected-site network and recurring revenue — not the panels.

What is realistically mobilisable — stated honestly

⚠ **The truth:** There is no single “EU solar grant” a private site can simply claim. Most CAPEX support is national/regional (often EU-co-financed); EU-direct funds are competitive. All amounts, windows and eligibility must be confirmed at application.

EU-direct (competitive — not guaranteed)

- Innovation Fund (EU-ETS, ≈€40bn 2020–30) — large-scale decarbonisation; fits the multi-site platform, not one camping. Competitive calls/auctions.
- LIFE – Clean Energy Transition — co-funds market uptake & coordination (modest).
- Horizon Europe — R&D&I grants for the EMS/AI software (consortia).
- InvestEU / EIB — green loans & guarantees (debt, not grants).

National / regional (where CAPEX support sits)

- France / Corsica: CRE tenders incl. island (ZNI) tenders — PV+storage strongly supported in non-interconnected zones; self-consumption premium (small systems); ADEME, France 2030, FEDER Corse.
- Spain: NextGen/PRTR self-consumption aid via IDAE & regions (largely committed — check residual windows); municipal IBI/ICIO rebates.
- Italy: Transizione 5.0 tax credit (time-limited), Conto Termico, energy-community incentives via GSE.
- Cross-cutting: regional ERDF/FEDER co-financing for SME renewables & tourism.

Island wedge: Corsica & Sardinia are non-interconnected — PV+storage carries the strongest support and the highest resilience value. Start there.

Sources to verify: European Commission (Innovation Fund, LIFE, Horizon), CRE & ADEME (FR), IDAE (ES), GSE & MIMIT (IT).

Co-development & co-investment — an open model

The investor — 3 profiles

- Industrial / EPC: capital, build & EPC margin
- Infrastructure: PV carports housing inverters & batteries
- Financial (fund / VC): capital only, financial return

COREPROMA / ECOGRID brings

- EMS / AI software core (the SaaS engine)
- Brand, O&M orchestration & ESG reporting
- Market access to the segment via COREPROMA

Shared

- Share pilot risk & milestone-based capital
- Jointly capture grants & green debt
- Co-own the replication pipeline & roadmap

Structure

Depending on profile: equity co-investment via asset SPVs (one per site or cluster) and/or industrial contribution (EPC, carports). Shared COREPROMA software core. Indicative pilot mix (5.7 M€): 1.4 M€ equity · 3.4 M€ green senior debt · 0.6 M€ grants · 0.3 M€ leasing.

Where I'd sharpen the plan before pitching

1 Lead with distribution

Your moat isn't panels — it's already reaching campings via COREPROMA. Distribution is the hardest part; put it on slide one.

2 Win on islands first

Corsica & Sardinia (ZNI): strongest support, highest resilience value, the most credible showcase.

3 Turn regulation into a sales driver

EPBD solar mandates, loi APER car-park solar, CSRD — operators will be forced to act. Arrive with the answer.

4 Productise label + carbon

Bundle Green Key/EU Ecolabel support, Guarantees of Origin and carbon reporting into the SaaS — recurring and sticky.

5 De-risk the capital

Milestone tranches + an audited financial model before scaling. Your own dossier flags the numbers as non-audited.

6 Design for the network

Long-term value is the VPP/aggregation network. Lock data ownership & the SaaS contract around that from day one.

From Corsican showcase to European platform

2026

Studies, permits, grid, financing

2027

Build pilot — Marine de Caprone

2028

Operate, prove KPIs, first contracts

2029-31

Industrialise: FR · IT · ES

2032-35

European platform, 100+ sites

What we expect from an investor partner

- Co-fund and co-build the Marine de Caprone pilot
- Agree the JV structure, roles and margin split
- Jointly target island (ZNI) tenders & green debt

Next step: audited financial model, energy site plan, supplier consultation and a JV term sheet.

ECOGRID RESORT™

the intelligent energy system for low-carbon holiday villages.
